

MARKS & CHANNELS

How can I visually represent two numbers

e.g., 4 and 8

MARKS & CHANNELS

Marks: represent **items** or **links**

Channels: change **appearance** based on **attribute**

Channel = visual variable

MARKS FOR ITEMS

Basic geometric elements

➔ Points

0D

➔ Lines

1D

➔ Areas

2D

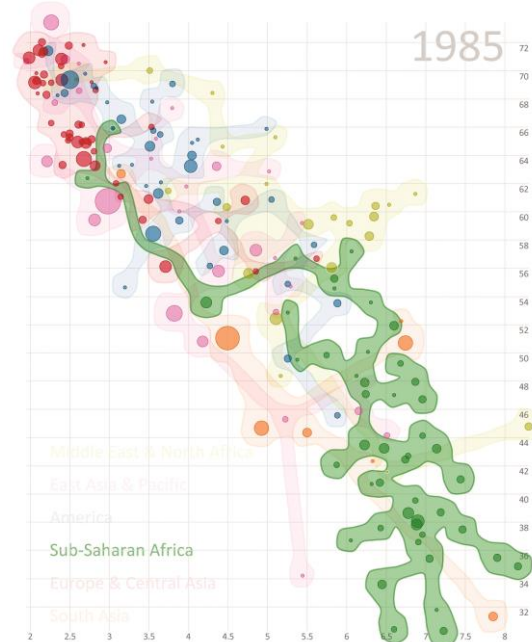

3D mark: Volume, but rarely used

MARKS FOR LINKS

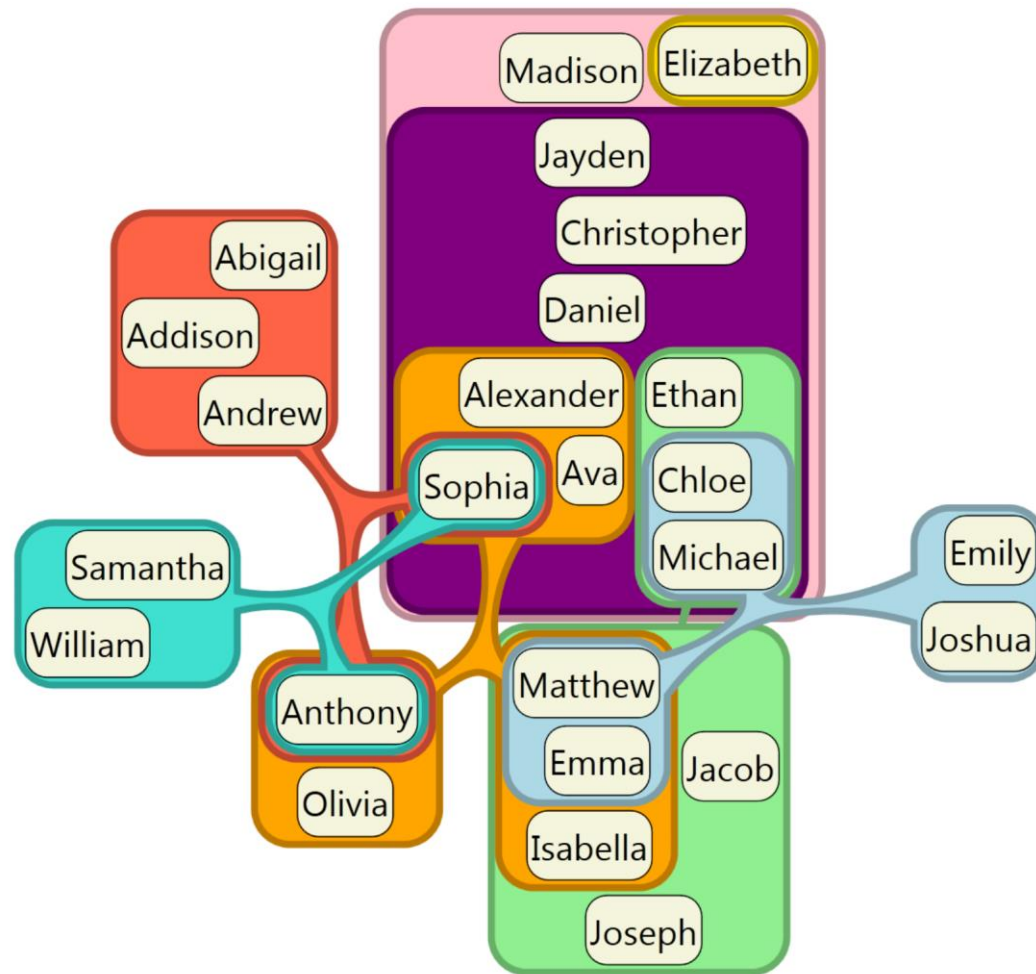

➞ Containment

➞ Connection

NESTED CONTAINMENT

CHANNELS

Change appearance proportional to or based on attributes

➔ Position

➔ Horizontal

➔ Vertical

➔ Both

➔ Color

➔ Shape

➔ Tilt

➔ Size

➔ Length

➔ Area

➔ Volume

JACQUES BERTIN

French cartographer

who makes or draws maps

Theoretical principles for visual encodings

BERTIN'S VISUAL VARIABLES

		Marks:	Points	Lines	Areas		
Variables of image		LES VARIABLES DE L'IMAGE					
Position	XY 2 DIMENSIONS DU PLAN	POINTS			LIGNES		
		Z			TAILLE		
		VALEUR			ZONES		
to distinguish images	Size (gray)Value	LES VARIABLES DE SÉPARATION DES IMAGES					
		GRAIN			COULEUR		
		ORIENTATION			FORME		

USING MARKS AND CHANNELS

Mark: Line

Channel:
Length, Position
1 quantitative attribute
1 categorical attribute

Mark: Point

Channel: Position
1 quantitative attr.

Adding Hue

+1 categorical
attr.

Adding Size

+1 quantitative
attr.

REDUNDANT ENCODING

Length, Position and Value

GOOD BAR CHART?

Rule: Use channel proportional to data!

TYPES OF CHANNELS

Magnitude channels

How much? Which rank?

Position

Length

Saturation ...

**Ordinal &
Quantitative data**

Identity channels

What?

Shape

Color (hue)

Spatial region...

Categorical Data

PRINCIPLES OF EXPRESSIVENESS AND EFFECTIVENESS

Expressiveness principle

The visual encoding should express **all of, and only**, the information in the dataset attributes

Effectiveness principle:

The importance of attribute should match the **salience** of the channel

Means:

- The most important attributes should be encoded with the most effective channels in order to be most noticeable
- Then the following important attributes match with less effective channels

RANK OF CHANNELS

Channels: Expressiveness Types and Effectiveness Ranks

➔ Magnitude Channels: Ordered Attributes

Position on common scale 

Position on unaligned scale 

Length (1D size) 

Tilt/angle 

Area (2D size) 

Depth (3D position) 

Color luminance 

Color saturation 

Curvature 

Volume (3D size)

WHAT VISUAL VARIABLES ARE USED?

Across U.S. Companies, Tax Rates Vary Greatly

Last week, in a Congressional hearing, Apple got grilled for its low-tax strategy. But not every business can copy that approach. Here is a look at what S&P 500 companies paid in corporate income taxes — federal, state, local and foreign — from 2007 to 2012, according to S&P Capital IQ. [Related Article »](#)

CHARACTERISTICS OF CHANNELS

Selective

- Is a mark distinct from other marks?
- Can we make out the difference between two marks?

Associative

- Does it support grouping?

Quantitative (Magnitude vs identity channels)

- Can we quantify the difference between two marks?

CHARACTERISTICS OF CHANNELS

Order (Magnitude vs Identity)

Can we see a change in order?

Length

How many unique marks can we make?

POSITION

Strongest visual variables

Suitable for all data types

Problems:

- Sometimes not available (spatial data, map)
- Cluttering (many items overlapped)

Selective: Yes

Associative: Yes

Quantitative: Yes

Order: Yes

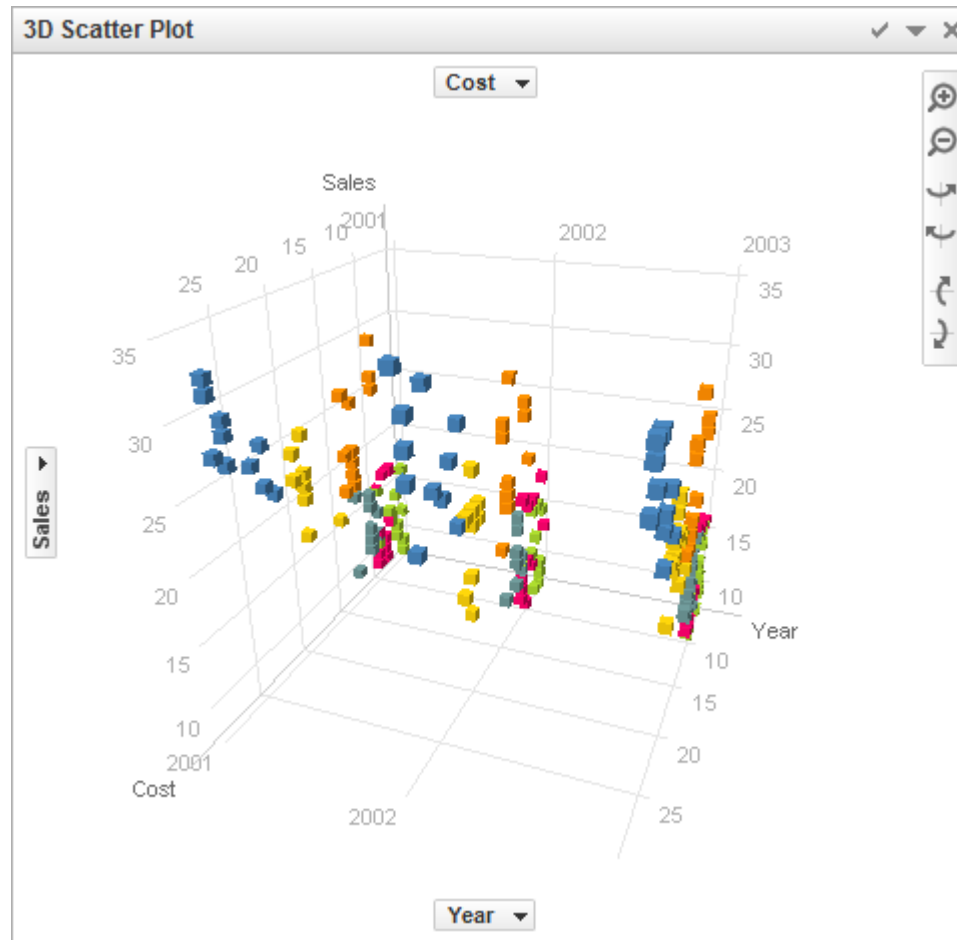

Length: Fairly big
(options)

→ Good channel

EXAMPLE: SCATTERPLOT

POSITION IN 3D? NOT SO GOOD

LENGTH & SIZE

Good for 1D, OK for 2D, Bad for 3D

Easy to see which one is bigger

Aligned bars use position redundantly

1D length:

Selective: yes

Associative: yes

Quantitative: yes

Order: yes

Length: yes

EXAMPLE 2D SIZE: BUBBLES

Four Ways to Slice Obama's 2013 Budget Proposal

Explore every nook and cranny of President Obama's federal budget proposal.

How \$3.7 Trillion Is Spent

Mr. Obama's budget proposal includes \$3.7 trillion in spending in 2013, and forecasts a \$901 billion deficit.

Circles are sized according to the proposed spending.

Color shows amount of cut or increase from 2012.

VALUE/LUMINANCE/SATURATION

OK for quantitative data when length & size are used

Not very many shades recognizable

Selective: yes

Associative: yes

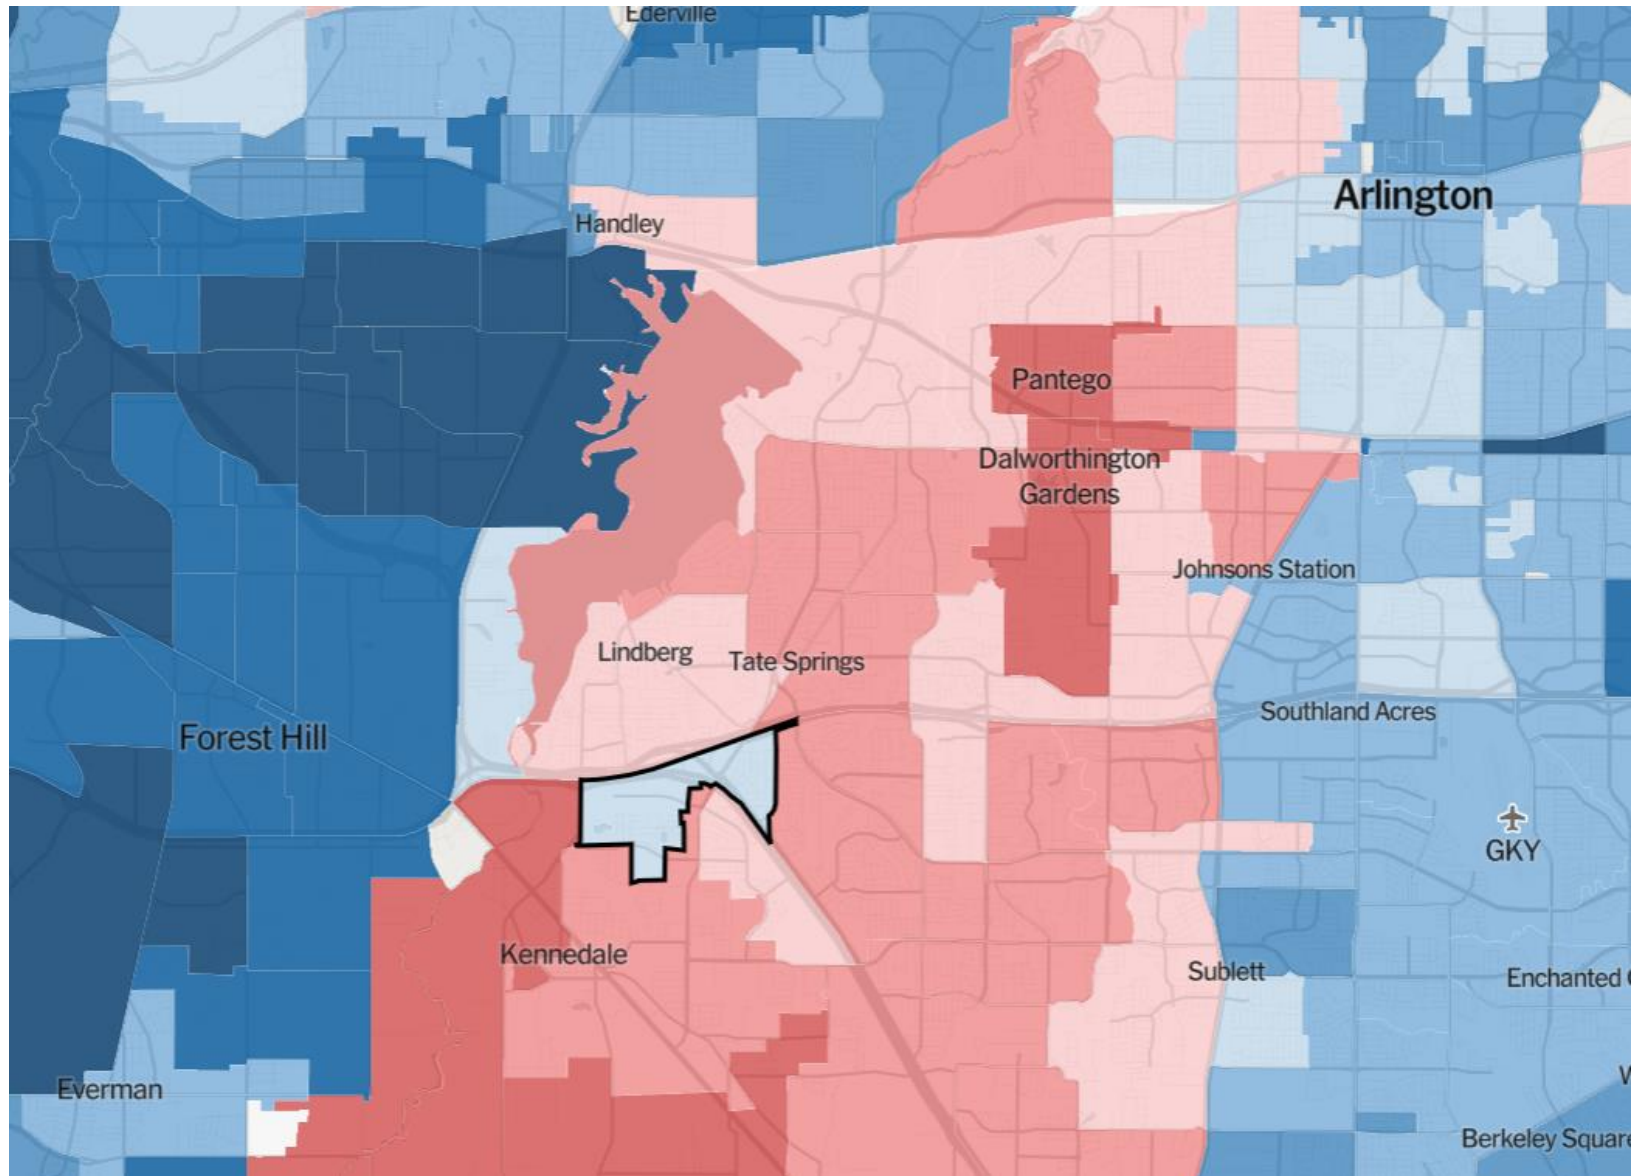

Quantitative: somewhat

Order: yes

Length: limited (around 7 – 8)

EXAMPLE: DIVERGING VALUE-SCALE

<https://www.nytimes.com/interactive/2018/upshot/election-2016-voting-precinct-maps.html#11.08/32.700/-97.197/115304>

COLOR

Good for qualitative data (identity channel)

Limited number of classes/length (7-10)

Do not work for quantitative data

Lots of pitfalls !

Good practice: minimize use of color for encoding data

Selective: yes

Associative: yes

Quantitative: no

Order: no

Length: limited

COLOR: BAD EXAMPLE

SANFORD AND SELNICK

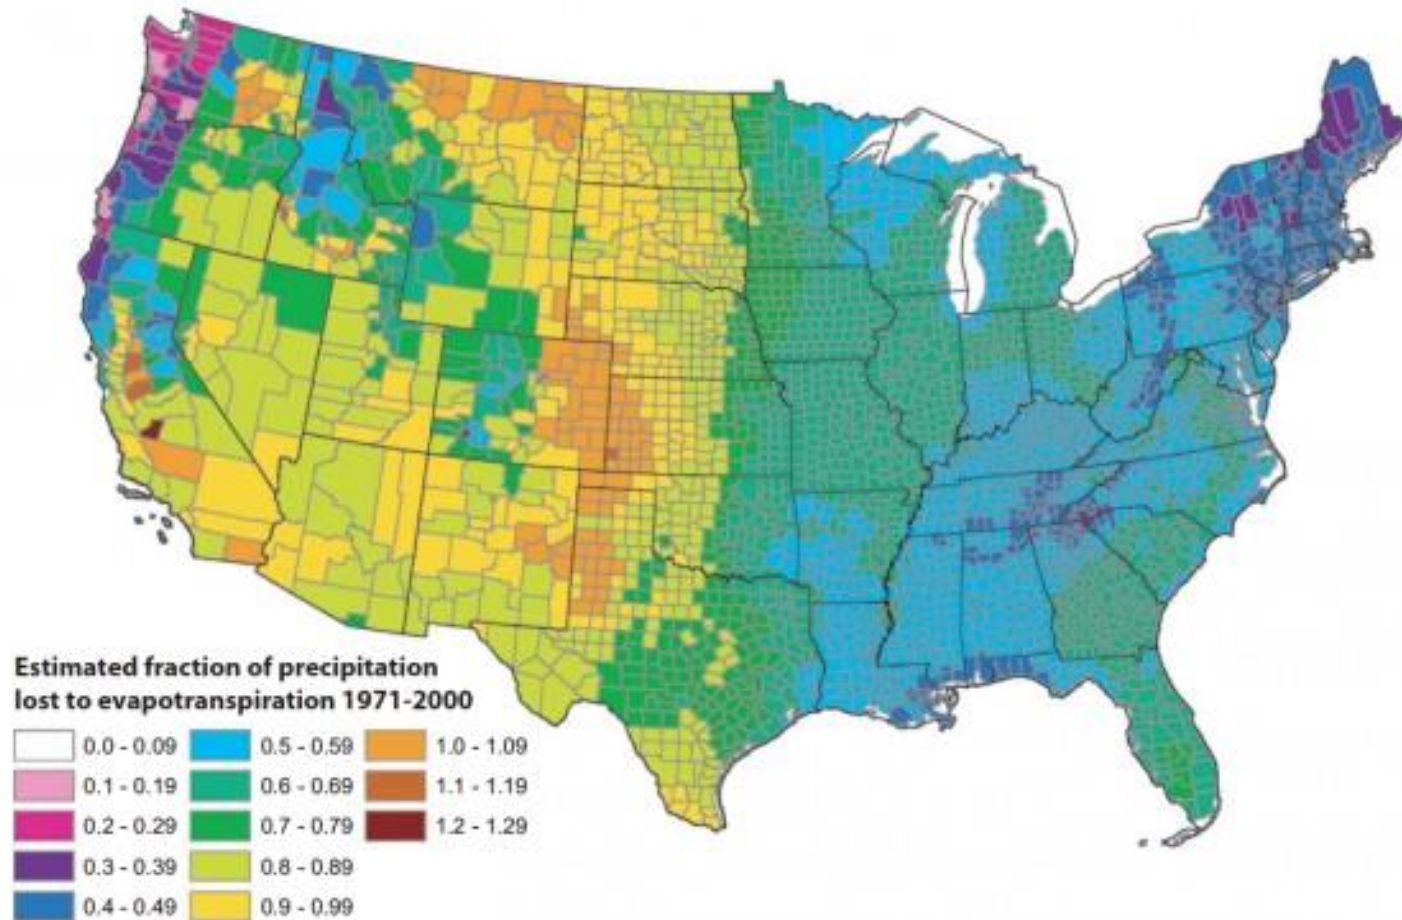

FIGURE 13. Estimated Mean Annual Ratio of Actual Evapotranspiration (ET) to Precipitation (P) for the Conterminous U.S. for the Period 1971-2000. Estimates are based on the regression equation in Table 1 that includes land cover. Calculations of ET/P were made first at the 800-m resolution of the PRISM climate data. The mean values for the counties (shown) were then calculated by averaging the 800-m values within each county. Areas with fractions >1 are agricultural counties that either import surface water or mine deep groundwater.

COLOR: GOOD EXAMPLE

Why Peyton Manning's Record Will Be Hard to Beat

By GREGOR AISCH and KEVIN QUEALY OCT. 19, 2014

The Broncos quarterback set the all-time N.F.L. touchdown passing record — and is still going strong.

SHAPE

Great to recognize many classes

No grouping, ordering

Selective: yes

Associative: limited

Quantitative: no

Order: no

Length: vast

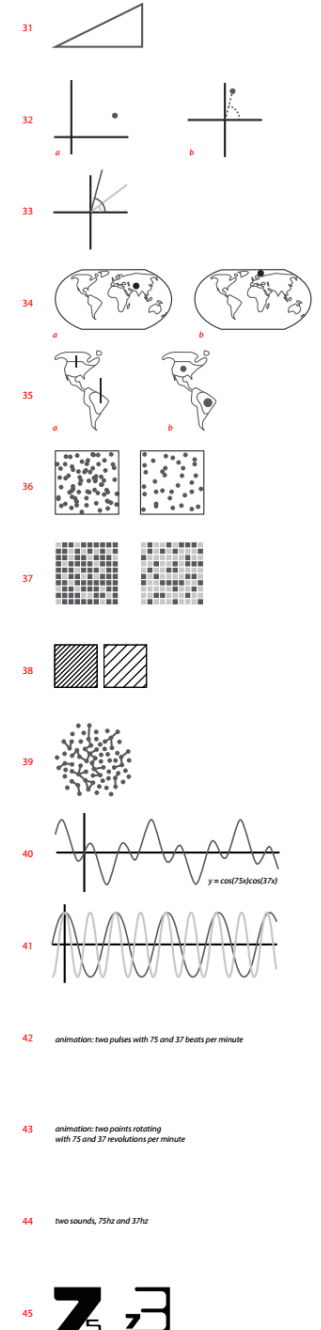

Idea: use facial parameters to map quantitative data

Does it work? Not really

Critique: <https://eagereyes.org/criticism/chernoff-faces>
